

When the next song starts

TIDAL needs a moment to start a song. Pressing play 2 s before the end was too late on your Mac: TIDAL's own next song began first, then the pick cut in. Now the delay is measured and play is pressed that much earlier.

BEST CASE

- Gapless, through TIDAL's queue

When TIDAL's own play queue can be read, the pick is put right after the current song. It only counts once the queue shows it as next, and it is checked again 10 s before the end. TIDAL then moves to it by itself: nothing cut, no gap.

OTHERWISE

- Timed start, learned

The pick's page opens 10 s before the end, and play is pressed early enough for TIDAL's start-up delay. That delay is measured on every hand-off from where macOS says the new song is. A longer delay is adopted at once, a shorter one gradually.

SETTINGS

- You can change
 - `handoff_seconds`: never later than this (3 s)
 - `handoff_margin`: extra on top of the delay (1 s)
 - `adaptive_handoff`: `false` to turn learning off
 - the delay is kept in `timing.json`
