

When the next song starts

TIDAL needs a moment to start a song. Pressing play 2 s before the end was too late on your Mac: TIDAL's own next song began first, then the pick cut in. Now the delay is measured and play is pressed that much earlier.

WHY NOT TIDAL'S QUEUE

- Started directly, on time

Handing the pick to the stock app's own queue left a blank entry and TIDAL stopped there, so picks are started directly. With the TidaLuna mod the queue works and is used; if TIDAL ever stalls on a queued pick, Tidal Shuffle starts it itself within a few seconds.

HOW IT WORKS NOW

- Timed start, learned

The pick's page opens 10 s before the end, and play is pressed early enough for TIDAL's start-up delay. That delay is measured on every hand-off from where macOS says the new song is. A longer delay is adopted at once, a shorter one gradually.

SETTINGS

- You can change

- `handoff_seconds`: never later than this (3 s)
- `handoff_margin`: extra on top of the delay (1 s)
- `adaptive_handoff`: `false` to turn learning off
- the delay is kept in `timing.json`
